

Name: \_\_\_\_\_

Between 4 & 9 pups hatch out of eggs and then grow inside the mother. Once hatched, they eat the unfertilized eggs - the ones that didn't turn into sharks - to grow and get stronger. When those are all gone, they will even eat each other!

Life Cycle  
of the  
Great White  
Shark

When shark pups are born they look just like the adults and they act like them too. They have sharp teeth and know how to hunt right away. They don't need their parents to take care of them.
